Sensitisation

No data available on the sensitisation of sodium carbonate.

Sodium carbonate is considered not to have any sensitising properties, based on the physiological role of both its constituent ions and its long-term historical and wide dispersive use in individual processes and consumer products.

Classification for sensitisation: is not warranted.

Repeated dose toxicity

Oral: Sodium carbonate dissociates into ions that are present physiologically in relatively high levels in vertebrates. Therefore, repeated dose toxicity studies are considered (Scientifically) unnecessary, in accordance with column 2 of REACH Annex VIII and IX. Furthermore, Sodium Carbonate is used as a food additive, which confirms that the substance has a low repeated dose toxicity.

Dermal : Sodium carbonate dissociates into ions that are present physiologically in relatively high levels in vertebrates. Therefore, repeated dose toxicity studies are considered

PRODUCT DATA SHEET: SODIUM CARBONATE (SOCALIM): Revision 4 Dated: 31/01/11

	(scientifically) unnecessary, in accordance with column 2 of REACH Annex VIII and IX.
Inhalation :	Sodium carbonate dissociates into ions that are present, physiologically in relatively high levels in vertebrates. Therefore, repeated dose toxicity studies are considered (scientifically) not necessary, In accordance with column 2 of REACH Annex VIII and IX.
Classification for repeated dose toxicity : is not warranted	
Mutagenicity:	In vitro- the available in vitrotests (SOS chromotest with sodium carbonate and Ames test with sodium bicarbonate) were negative. Furthermore sodium bicarbonate is naturally present in cells and both the structure of sodium bicarbonate and sodium carbonate do not indicate a genotoxic potential. Therefore, there is no reason to evaluate the potential Gentoxicity of sodium carbonate further and no genotoxic effects are expected.
Carcinogenicity:	No data available for carcinogenicity of sodium carbonate. Although the substance has a wide and varied use, there are no indications that it can induce hyperplasia, pre-neoplastic lesions or is mutagenic. Therefore a carcinogenicity study is considered unnecessary.
Classification for carcinogenicity is not warranted	
Reproductive toxicity	
Fertility:	No data available
Developmental Toxicity:	In accordance with section 1 of REACH Annex XI, testing does not appear Scientifically necessary, as the substance will usually not reach the foetus or the male and female reproductive organs when exposed orally, dermally or by inhalation, as it does not become available systemically. As such, it is considered not useful to perform a reproduction study.
Classification for reproductive toxicity according to Regulation (EC) 1272/2008 is not required	
12. ECOLOGICAL INFORMATION	
12.1 Toxicity	
Acute/short term toxicity to fish	
LC ₅₀ (96h) for freshwater fish : 300 mg/l	
Chronic/long term to toxicity to fish	
Study scientifically unjustified, sodium carbonate dissociates readily into sodium and carbonate ions in an aquatic environment. Both ions originally exist in nature, and their concentrations in surface water are dependent on various factors, such as geological parameters, weathering and human activities. Therefore there is a continuous source of both ions into the environment and have been measured extensively in aquatic ecosystems.	
Acute/short term toxicity to aquatic invertebrates	
EC ₅₀ (48h) for freshwater invertebrates : 200-227 mg/l	
Chronic/long term toxicity to aquatic invertebrates	
Study scientifically unjustified, sodium carbonate dissociates readily into sodium and carbonate ions in an aquatic environment. Both ions originally exist in nature, and their concentrations in surface water are dependent on various factors, such as geological parameters, weathering and human activities. Therefore, there is a continuous source of both ions into the environment and have been measured extensively in aquatic ecosystems.	
Acute toxicity to algae and aquatic plants	
Study scientifically unjustified, sodium carbonate dissociates readily into sodium carbonate ions in a aquatic environment. Both ions originally exist in nature, and their concentrations in surface water are dependent on various factors, such as geological parameters, weathering and human activities. Therefore, there is a continuous source of both ions into the environment and have been measured extensively in aquatic systems	
Toxicity to soil macro-organisms	
In accordance with REACH Annex XI a study is not required as in water sodium carbonate is dissociated into sodium and carbonate ions, both of which will not absorb on particulate matter. Furthermore, exposure of the soil compartment is unlikely.	
Toxicity to terrestrial plants	
In accordance with REACH Annex XI a study is not required as in water sodium carbonate is dissociated into sodium and carbonate ions, both of which will not absorb on particulate matter. Furthermore, exposure of the soil compartment is unlikely.

Conditions and measures related to municipal sewage treatment plant

Wastewater streams of the glass industry do not contain sodium carbonate as it is stored in covered silos and not linked to internal sewage systems.
